Thank you for trusting our products! Below are some tips to optimize the use of your distributors (references: 126905205pr and 043905205R).

Preparation Before Use

To ensure the proper functioning of our competitively priced distributors, please follow these essential steps before installation:

- **Lubrication of the Contact Shaft:** Use grease to lubricate the contact shaft with the contact breaker points, ensuring smooth rotation and minimal wear.
- **Checking Screw Tightness:** Make sure all the screws on the distributor are tightened to prevent any mechanical failure due to loose screws during operation.

Recommended Improvements

Our distributors offer an economical and effective solution, but for optimal performance and durability, we recommend considering the following enhancements:

- **Changing the Distributor Cap**: Choose a higher-quality distributor cap for better electrical current distribution.
- **Replacing the Distributor Rotor:** A higher-quality distributor rotor will ensure a more precise and reliable connection.
- **Using Quality Contact Breaker Points**: Opt for contact breaker points made in Germany or other renowned manufacturers for better wear resistance and greater reliability.

We hope these tips will be helpful and contribute to the efficiency and longevity of your equipment. For any further questions or assistance, do not hesitate to contact our customer service: contact@dream-machine.fr
